The All-on-4® Treatment Concept

WIAND DENTAL
LABORATORY

Please Note...

The following information is not a treatment plan. Appropriate treatment for any patient is at the discretion of your dentist. At Wiand, we assist in executing treatment as prescribed by your dentist. The steps presented in this presentation are based on our laboratory perspective from our experience. They give you a simple overview of how Teeth-on-a-Day happens. We hope that this helps you to understand the concept.

How Do You Feel About Tooth Loss?

- A healthy looking smile ranks among the top 3 aspects of a person's appearance that affect self-esteem.
- 96% of adults believe an attractive smile makes them more appealing to the opposite sex.
- 73% of Americans say they would feel self-conscious if they lost a tooth or their teeth.
- 74% of adults feel an unattractive smile can hurt a person's chance for career success.
- 66% of Americans say tooth replacement is a medical necessity, not just a cosmetic nicety.

The Facts on Tooth Loss

- A person's quality of life is diminished as a result of tooth loss due to a reduction in the ability to chew and speak and resulting in reduced social interactions.
- By age 50, Americans have lost an average of 12 teeth including their third molars (wisdom teeth).
- Nearly 30% of adults over 65 have lost all of their natural teeth, primarily due to tooth decay and gum disease.
- Tooth loss in the elderly is linked to inadequate nutrition intake because of the limited types of food that person can eat.
- At all ages, men are more likely than women to have severe periodontal disease.

Why Teeth-in-a-Day?

It allows you to avoid the need for dentures and enables you to regain 90% chewing function like you had when your teeth were healthy!

What is it?

Teeth-in-a-day is a complete full arch solution where a fixed implant bridge replaces missing or failing teeth with a full arch of new beautiful teeth anchored by 4 or more dental implants the same day!

How is it Possible?

Due to advancements in dental implant technology and 25 years of research, dental implants that are splinted together can now be immediately loaded on the day they are placed. This means that implants no longer need to fully integrate and heal for an extended period of time before teeth can be secured to them.

Why is the Team Important?

Teeth-in-a-day requires a team approach utilizing the expertise of your dentist, a surgeon and a qualified dental technician to make this otherwise lengthy process happen in one short day.

Is it Really Teeth-in-a-Day?

On the day of surgery, the patient receives provisional or temporary set of teeth that will later need to be replaced with a final prosthesis called a fixed hybrid bridge after the implants have fully integrated and healed.

Step 1 - Impressions

First impressions, a bite registration and photos are taken of your current dentition at your dentist's office.

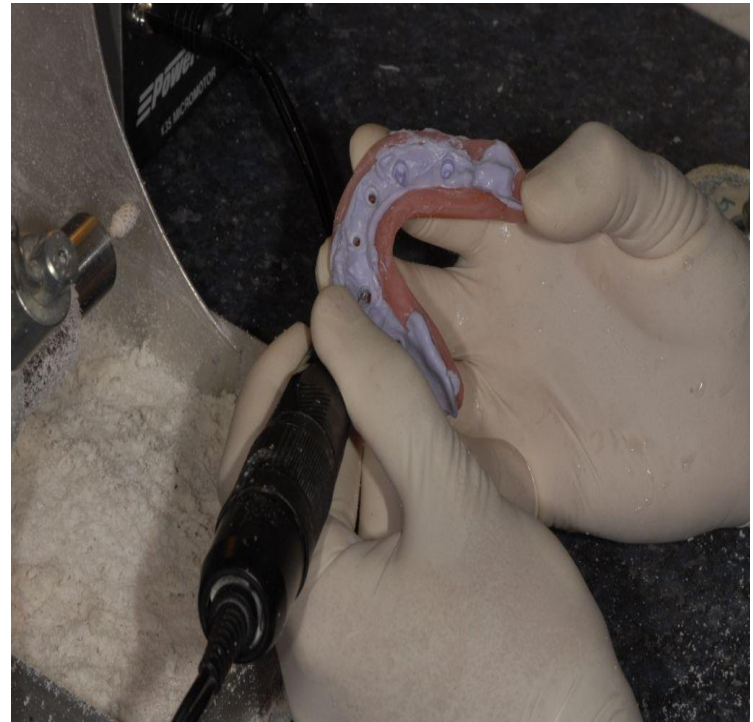

Step 2 – Teeth Fabricated

Next, a temporary set of teeth are made before the day of dental implant surgery that will be modified to become a custom fixed bridge during surgery by a *qualified* dental lab partner.

Step 3 – Surgery

On the day of surgery, remaining teeth are extracted and implants are placed then immediately loaded with the temporary set of teeth once the teeth are customized to fit onto the implants secured by implant screws.

Step 4 – Check Function

Within one week,
your dentist will
check the function
of your new teeth.

Step 5 – Final Restoration

After the implants have healed for 6 months, a permanent set of teeth will then be fabricated and secured onto a fixed titanium implant bar making it a fixed hybrid bridge. This will happen in 3 or more appointments at your dentist's office.

Temporary Set of Teeth

Your provisional or temporary set of teeth will be made completely from acrylic incorporating the abutments that will attach the bridge to the dental implants. This prosthesis will extend back to the first molar area which is necessary for proper implant healing.

Permanent Set of Teeth

Your permanent or final set of teeth will be made with acrylic incorporating a titanium framework for long-term support that will be anchored to the dental implants with prosthetic screws through holes in the prosthesis. These holes will be covered and disappear after inserting the prosthesis. Your final prosthesis will go back to the second molar area in most cases.

Are You a Candidate?

Patients that have one or more of the following dental challenges may be a candidate for teeth-in-a-day:

- Severe periodontal disease
- Missing teeth
- Failing teeth
- Failing crown and bridge work
- Unhappy denture wearers

Patient Benefits

- Fixed restoration (non-removable by the patient)
- One day procedure (wake with teeth)
- Avoids the denture phase (go right to a fixed restoration)
- Next best thing to real teeth (a third set of dentition)
- Immediate function (90% after healing)
- Minimal time at the dentist (4 hours plus surgery)

Patient Benefits

- Easy recovery with minimal discomfort
(usually ibuprofen is enough)
- More affordable due to fewer implants (usually 4)
- Easy to clean and maintain (highly polished finish)
- Complete long-term full arch solution
(do inevitable now and save money in the end)
- Lifetime restoration in most cases (a final solution)

Patient Benefits

Best of all, it is a ***life changing treatment*** option that will allow you to regain your youthful smile, restore your confidence and once again eat what you want, not just what you can!

EVEN AN APPLE!

Why Use Your Dentist for Teeth-in-a-Day?

Your dentist knows you best!

- Your dentist has monitored and documented your oral health history and has all the information necessary at hand to offer the best options for your personal oral situation.
- Your dentist has the freedom to choose your team based on his/her experiences and the particular needs of your personal oral situation.
- Your dentist will provide the continuing care you need and deserve for a lifetime!

Maintaining Your New Smile

While teeth-in-a-day is a final full arch solution, your new fixed implant bridge will need to be maintained in the following ways:

- Screws may need to be replaced each time your dentist removes the prosthesis. Good hygiene habits will reduce how often this needs to be done. This is part of regular necessary maintenance.
- The titanium bar lasts for life in most cases, but the teeth may need to be replaced every 5-8 years depending on the type of teeth you choose, your opposing dentition and wear.
- Consistently wearing a night guard provided by your dentist will help to protect your restoration.

Maintaining Your New Smile

- Daily hygiene using a soft toothbrush with light pressure followed by proxy brush and/or Waterpik™ to clean under the prosthesis and around the implants. (Avoid regular toothpaste and other harsh abrasives)
- Regular hygiene visits to your dentist to treat both arches every 6 months.
- **Keep your provisional** in case your final set of teeth needs to be repaired for any reason preventing any emergencies.
